Yummy Games exposes a set of interfaces to enable application-to-application communication over the Internet using SOAP Web Services. The platform has been developed to support high volume, transactional-based e-commerce systems, as well as provide the highest quality of service for content distribution.

Game data servers can be strategically placed in single or multiple locations to improve download and latency metrics. And Yummy's Web Services can be called from any platform using standard Internet protocols. Game content can be delivered from any HTTP 1.1 compliant web server such as Apache or IIS or a CDN.

REDUCE BANDWIDTH COSTS

Gamers will spend less time downloading and managing their games and more time playing them with Yummy's unique streaming technology, which circumvents the need for end-users to download an entire game before starting to play a game.

Yummy's streaming significantly speeds up delivery of game downloads by up to 90%. Download wait times are optimized, especially for large file PC games. Not only will consumers save time, but hosting and bandwidth costs are reduced.
